ROLL NO:240701027

Survey Report on Emerging Trends in Low-Code Application Development for a Loan Application Form

1. AIM

To study the emerging trends in low-code application development and compare them with traditional application development by designing a Loan Application Form using a low-code platform. The experiment aims to understand the benefits, challenges, and features of low-code platforms used to develop business applications quickly and efficiently.

2. TRADITIONAL APPLICATION DEVELOPMENT VS EMERGING TRENDS IN LOW-CODE APPLICATION DEVELOPMENT

Traditional Application Development

Traditional application development is a method of creating software applications by writing code using programming languages such as Java, Python, HTML, CSS, and JavaScript. Developers manually design the user interface, create databases, implement business logic, and perform testing. For a loan application form, traditional development requires programmers to create input fields for applicant details, loan amount, income, loan type, and repayment information. The developer must also write code for form validation, database storage, and loan application processing.

Features of Traditional Application Development:

- Requires programming knowledge and technical skills.
- Developers manually write and maintain application code.
- Provides flexibility for customized application features.
- Testing and debugging are performed by developers.

Emerging Trends in Low-Code Application Development

Low-code application development is an approach that allows users to build applications using visual interfaces, drag-and-drop components, pre-built templates, and minimal manual coding. Platforms such as Zoho Creator, Microsoft Power Apps, and OutSystems help developers create applications more quickly. For a loan application form, a low-code platform can be used to create fields such as Applicant Name, Email, Loan Type, Loan Amount, Employment Status, and Loan Status.

Emerging Trends in Low-Code Development:

- **Visual Application Development:** Applications are designed using drag-and-drop components.
- **Workflow Automation:** Loan approval processes and notifications can be automated.
- **AI-Assisted Development:** AI features can help generate application components, formulas, or workflows where supported.
- **Cloud-Based Development:** Applications can be developed and accessed through cloud platforms.

SCREENSHOTS:

The screenshot displays a mobile application interface titled "My first Creator app". The left sidebar contains a navigation menu with options: Home, All Requests, Add Request, Loan Applications (expanded), loan application form (selected), and All Loan Applications. The main content area shows a "loan application form" with the following fields:

- application name:** Two input fields labeled "First Name" and "Last Name".
- Email address:** A single input field.
- residential Address:** Two input fields labeled "Address Line 1" and "Address Line 2".
- City / District:** An input field.
- State / Province:** A dropdown menu with a "-Select-" placeholder.
- Postal Code:** An input field.
- Country:** A dropdown menu with a "-Select-" placeholder.
- contact number:** An input field with a country code dropdown set to "+91" and a pre-filled number "81234 56789".
- PAN number:** An input field.
- purpose of loan:** An input field.

The bottom of the screen shows a status bar with the name "Akilaa" and a battery icon.

3. BENEFITS AND CHALLENGES IN LOW-CODE APPLICATION DEVELOPMENT

Benefits of Low-Code Development

Low-code application development provides a simple way to build applications with less manual programming. It is useful for organizations that want to develop business applications efficiently while reducing repetitive coding work.

Benefits:

1. **Faster Development:** Applications can be created quickly using pre-built components and visual tools.
2. **Reduced Coding Effort:** Developers can reduce the amount of manual code required for common features.

- 3. Easy Form Creation: Loan application forms can be created using fields, dropdowns, radio buttons, and other components.
- 4. Workflow Automation: Loan submission, verification, and status notifications can be automated.
- 5. Database Integration: Applicant details and loan records can be stored in an integrated database.

Challenges of Low-Code Development

Although low-code platforms simplify development, they also have limitations that should be considered when developing business applications such as loan management systems.

Challenges:

- 1. Limited Customization: Complex requirements may require custom code or platform-specific solutions.
- 2. Platform Dependency: Applications may depend on the selected low-code platform and its features.
- 3. Security Concerns: Loan applications contain sensitive financial and personal information, so proper security controls are required.
- 4. Integration Limitations: Connecting to external banking systems or APIs may require additional configuration.
- 5. Performance Issues: Applications with complex workflows or large datasets may require performance optimization.

4. COMPARISON OF EXISTING LOW-CODE PLATFORMS

The following table compares commonly used low-code application development platforms for building a loan application form.

Comparison Criteria	Zoho Creator	Microsoft Power Apps	OutSystems	Mendix
---------------------	--------------	----------------------	------------	--------

Platform Type	Low-code application platform	Low-code business application platform	Enterprise low-code platform	Enterprise low-code platform
Form Creation	Visual form builder	Canvas and model-driven apps	Visual development tools	Visual development tools
Database Support	Built-in data management	Dataverse and other data sources	Integrated application data capabilities	Integrated data modeling
Workflow Automation	Workflows and Deluge scripting	Power Automate integration	Visual workflows and logic	Visual workflows and microflows
Customization	Forms, scripts, and integrations	Connectors, formulas, and custom components	Custom logic and integrations	Custom logic and integrations
Loan Form Application	Applicant registration and loan records	Business loan workflow and approval applications	Complex enterprise loan applications	Enterprise loan processing applications
Ease of Development	Suitable for rapid business application development	Useful for organizations using Microsoft services	Suitable for enterprise application development	Suitable for enterprise application development

5. RESULT

The survey report on emerging trends in low-code application development was completed. The study compared traditional application development with low-code development and examined the benefits and challenges of low-code platforms. A loan application form was identified as a suitable business application that can be developed using a platform such as Zoho Creator. Low-code development provides visual tools, workflow automation, and database integration, which can simplify the development of form-based applications.
